

JD-to-Resume Keyword Matching

Portfolio Demonstration — Fictional Candidate

Target Role: Senior Java Backend Engineer

Purpose: Demonstrate how a job description can be compared with a resume to identify keyword alignment and optimization opportunities.

1. SAMPLE JOB DESCRIPTION

Key Requirements: Java, Spring Boot, REST APIs, Microservices, SQL, AWS, Docker, Kubernetes, CI/CD, Agile/Scrum, API development, and application performance optimization.

2. KEYWORD MATCHING ANALYSIS

Requirement	Resume Match	Recommended Action
Java	Strong	Keep and emphasize
Spring Boot	Strong	Keep and emphasize
REST APIs	Strong	Highlight in experience
Microservices	Moderate	Increase visibility where accurate
SQL	Strong	Keep
AWS	Moderate	Highlight relevant experience
Docker	Limited	Include only if supported
Kubernetes	Missing	Do not add without experience
CI/CD	Moderate	Highlight relevant work
Agile/Scrum	Strong	Keep
API Development	Strong	Highlight
Performance Optimization	Moderate	Add relevant examples if supported

3. BEFORE → AFTER EXAMPLE

Before: Developed applications using Java and worked with the development team to resolve issues.

After: Developed Java and Spring Boot backend applications and REST APIs, collaborated with Agile teams, resolved application issues, and supported scalable software solutions.

4. ALIGNMENT SUMMARY

Strongly represented: Java, Spring Boot, REST APIs, SQL, Agile/Scrum.

Needs stronger visibility: Microservices, AWS, CI/CD, performance optimization.

Potential gaps: Docker and Kubernetes based on the fictional sample. These should not be added unless the candidate genuinely has the experience.

5. PROCESS DEMONSTRATED

Analyze the JD → Extract requirements → Compare against resume → Identify alignment gaps → Improve relevant content → Verify accuracy.

Important: This is a fictional portfolio demonstration. It does not represent a real client project or guarantee ATS/interview results.
